Matching patients to clinical trials

64 years old woman with:

- multiple myeloma,
- s/p allogeneic transplant with recurrent disease and with systemic amyloidosis (involvement of lungs, tongue, bladder, heart),
- on hemodialysis for ESRD who represents for malaise, weakness, and generalized body aching x 2 days.
- she was admitted with hypercalcemia and treated with pamidronate 30mg, calcitonin, and dialysis.
- patient was initially treated with melphalan and prednisone, followed by VAD regimen, and autologous stem cell transplant.
- with relapse of her myeloma, she received thalidomide velcade and thalidomide, which were eventually also held due to worsening edema and kidney function.

*Demo from Bogatu, Jullien
Jullien et al. (Semeval 2022, EMNLP 2023)*

The background features a complex network of white nodes and connecting lines, resembling a molecular structure or a data network. The nodes are of varying sizes, with one notably larger node on the left side. The lines are thin and create a dense web of connections across the entire frame. The overall color scheme is a gradient of purple and magenta.

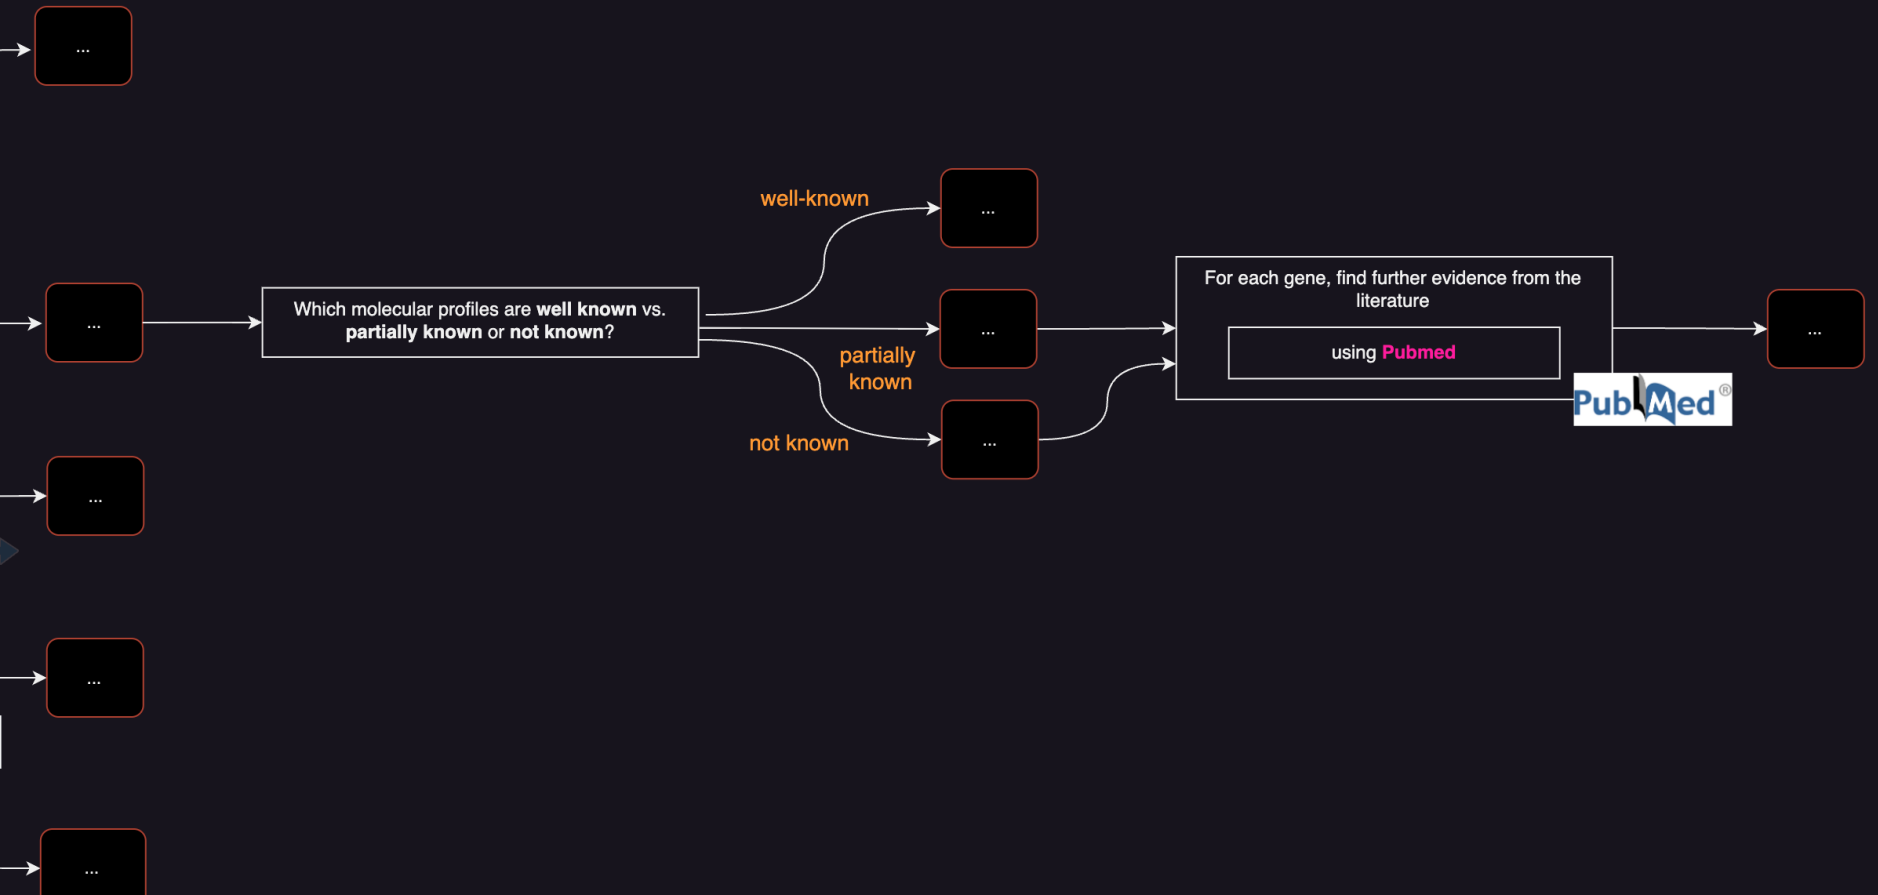

Evidence-based Scientific Reasoning

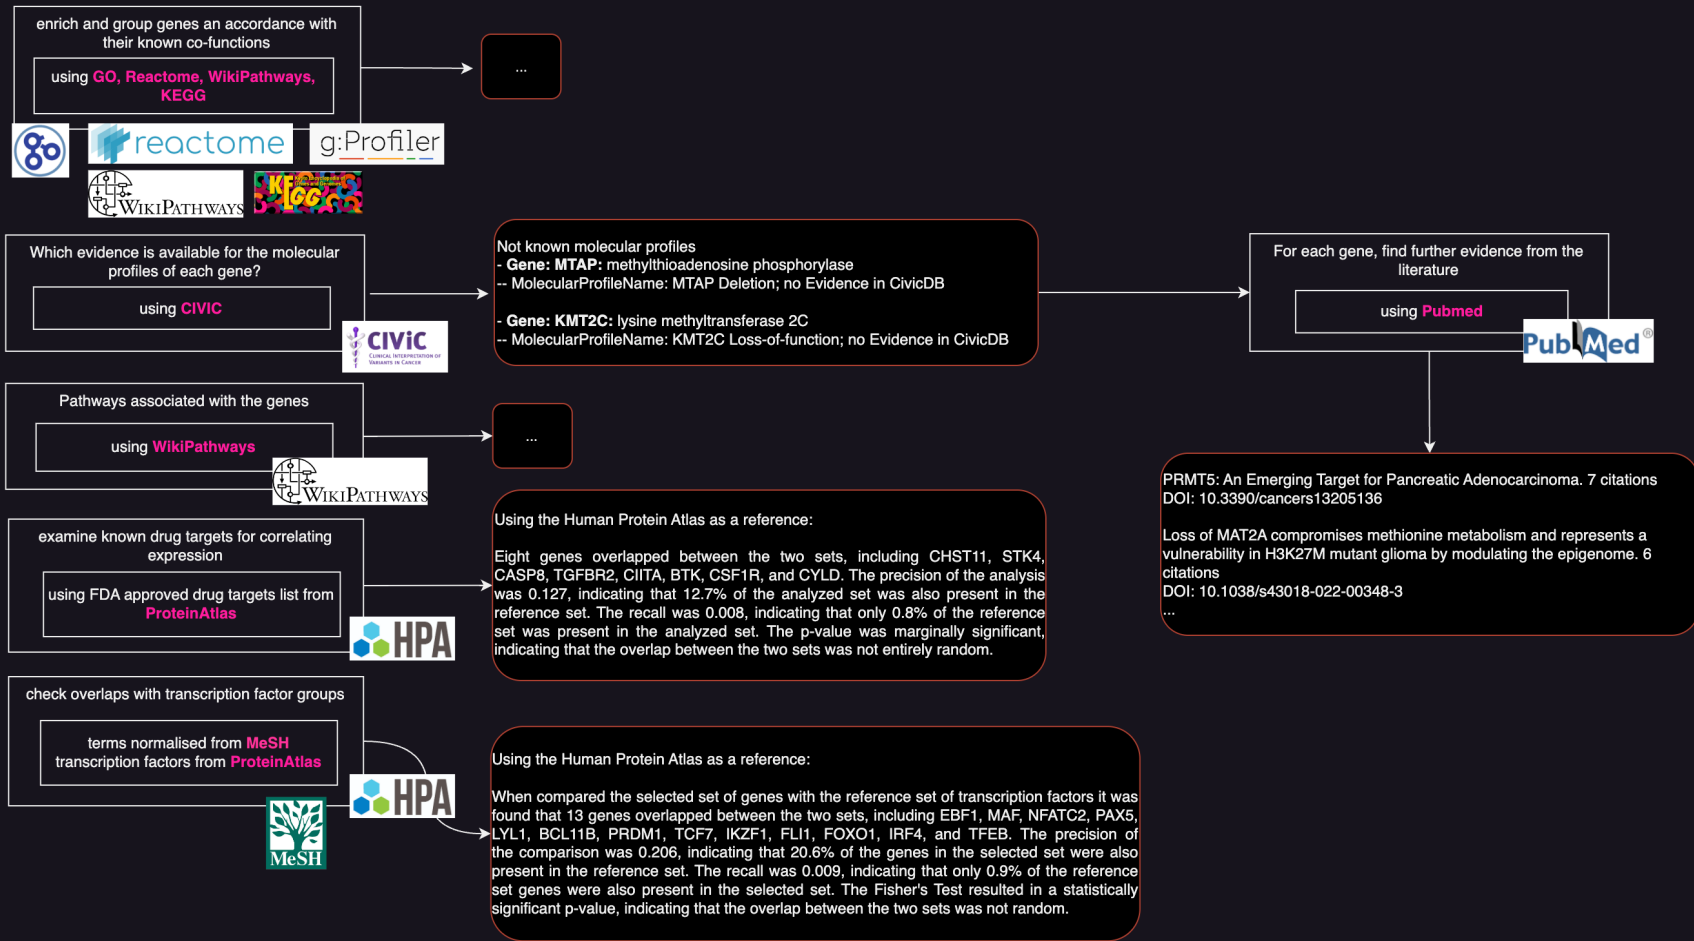

Biomarker discovery & LLMs

Partial Results

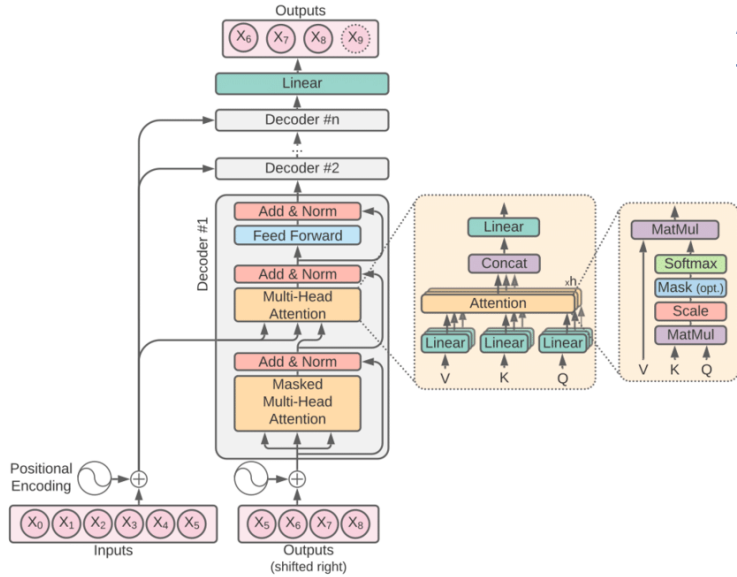

Multi-omics data integration

The unreasonable effectiveness of transformers

Adapting transformers for multi-omics data analysis to improve the modelling of heterogeneous cell states/populations

Intuition: ground-up modelling of the 'cell-discourse'

Vaswani et al (NeurIPS, 2017)

Brown et al (Arxiv:2005.14165, 2020)
Stienon et al (NeurIPS, 2020)

Modelling complex cell-states for biomarker discovery

ML, Statistical inference models

Modelling complex cell-states for biomarker discovery

Applications

- Biomarker discovery, improving patient stratification and tumour subtyping.
 - Improving biological understanding between responders and non-responders.
- Improving clinical trial design – integrating maximum available evidence.
- Dose optimisation.
- Improving the prediction of toxicity effects.
- Improving patient-treatment matching and patient accessibility to clinical trials.
- Improving the understanding and outcomes of clinical trials:
 - Optimising screening.
 - Reducing patient drop-out.
 - Understanding protocol deviation.
- Organising observational evidence in the clinic – structuring electronic health records.
- Major implications in terms of optimising drug discovery pipelines
 - E.g. Drug repurposing.

Concluding remarks

Take away

New emerging foundations for analytical inference in oncology

Universal framework for integrating, organising and reasoning over heterogeneous evidence

Significant analytical changes

Selection & integration of unstructured and structured evidence **at scale**

Better integration between **mechanistic** and **data-driven** inference

Common denominator

Addressing analytical barriers in personalised/experimental cancer medicine

More specific phenomena (personalised response, smaller cohorts)

($p \gg n$)

More data per patient

Take away

Large Language Models

Are a **(monumental!)** game-changing foundation.

Transformers are an efficient substrate for modelling language, omics and reasoning.

Fluidity/lower impedance between representation modalities:

... Text, Databases, Pathways, Equations, Code ...

Alone LLMs are not fit for purpose for biomedical reasoning.

Evidence-based reasoning

Biomedical AI-based reasoning **requires complex coordination pipelines.**

... and domain experts building them.

Implement once, reuse forever.

Allows using **maximum available evidence.**

Magnitude order efficiency gains.

Thank you for your attention!

Work in collaboration with:

Alex Bogatu, Caroline Dive, Danilo Carvalho, Donna Graham, Fouziah Butt, Loic Verlingue, Louise Carter, Marco Valentino, Maxime Delmas, Harriet Unsworth, Mael Julien, Magdalena Wysocka, Oskar Wysocki
